Demo video: ready-to-speak script

Vendor onboarding, from submission to decision. About 4 minutes of talking plus clicks, under the 5:00 limit. Read the large text out loud. Text in brackets is something you do on screen.

1. Intro

0:00 to 0:30

On screen: Onboard vendor page on screen.

Hi, I'm Shubham. I chose problem statement two: vendor onboarding.

Before a company can be paid, someone has to check its tax ID, its bank details and its documents. When that goes wrong, you get payment fraud or compliance trouble.

So I built a process that takes a vendor submission and gives a clear answer: approved, pending review, or rejected. It shows its reasoning, and it tells the vendor exactly what to do next.

2. Tech stack

0:30 to 1:00

On screen: Stay on the app (or the GitHub repo page).

It's a Flask web app with a SQLite database, and a small library called rapidfuzz for comparing names. It's hosted on Render.

One deliberate choice: the decisions come from fixed rules, not from an AI, because a fraud control has to be explainable and give the same answer every time.

I used AI, Claude Code, to build it fast and to generate test cases. Over two hundred automated checks run before every release.

3. Workflow

1:00 to 1:35

On screen: Switch to the GitHub workflow page. Scroll the first two diagrams.

Here's the workflow. Each submission runs through eight visible stages. Are the fields complete? Is the country supported? Are the IDs and bank codes valid? Are the right documents there? Do the IDs agree with each other? Does the company name match the bank account holder? Does a registry and sanctions list check out? And is this company already on file?

There are three outcomes. Approved. Rejected, with a plain list of what is wrong. Or pending review, when only a person can decide. Every application is decided once: if the vendor got something wrong, it is rejected and closed, and they apply again.

4. Happy path

1:35 to 2:15

On screen: Back to the app. JSON file tab, pick 01, click Submit.

First, a clean vendor. *[Submit]*

You can see each stage run live on the right, and they all pass. Approved, with a plain message to the vendor.

Now the same vendor applies again, with nothing new. *[Submit 01 again]*

It says: you're already registered. Nothing is created twice, so there's no duplicate vendor to pay.

5. Edge case 1: an incomplete form

2:15 to 3:00

On screen: Pick 02, click Submit.

Now an edge case: an incomplete form. No email, no tax ID, no bank proof, and a document in the wrong slot. *[Submit]*

It's rejected, and the message lists exactly what's missing and where to upload, in plain words. *[pause so they can read it]*

Nothing stays open. The vendor fixes the form and sends a new application, and every check runs again from scratch. That's deliberate:

nothing is inherited, so a fraudster can't keep nudging one application until it passes.

6. Edge cases 2 and 3: wrong identity

3:00 to 3:40

On screen: Pick 03, Submit. Then pick 05, Submit.

A US company with an Indian GSTIN. *[Submit 03]* The tax ID doesn't fit the country, so it's rejected and the message says so.

Now two contradictions at once. *[Submit 05]* The message names both of them in plain words, so the vendor knows exactly what to check against their registration documents.

7. Edge case 4: bank account change

3:40 to 4:25

On screen: Submit 01 first, then pick 06, Submit. Open Reviewer desk. Take, choose a verification method, type a reason, Approve.

The payment-fraud case. A vendor that's already onboarded suddenly changes its bank account. *[Submit 06]*

It can't be auto-approved. The vendor only sees: under review.

On the reviewer desk I see what is the same and what is different. *[click Take]* The server won't let me approve until I record an independent check, like a callback to a trusted contact. *[choose a method, type a reason, click Approve]* The vendor is told automatically.

8. Dashboard and messages

4:25 to 4:45

On screen: Open Dashboard, then Messages.

The dashboard shows every run with its status and reasons. Messages shows what each vendor was sent, one thread per application. The mail is simulated because the addresses are fake, but the outbox is real.

9. Close

4:45 to 5:00

On screen: Stay on the dashboard.

The limits, honestly. The registry and sanctions list are demo data, document contents aren't read, and it covers India, the US and Germany.

Next, I'd connect real registries and a bank verification service. Thanks for watching.

Before you record

1. Open the live link a minute early so the free host wakes up. 2. Click Demo tools, then Reset demo data. 3. Submit sample 01 first (06, 08 and 09 compare against it). 4. Open three tabs: the app, the GitHub workflow page, the About page.

If you run over 5:00

Drop section 6 (look-alike) first. Then shorten section 8 to one sentence.

If the live site is slow

Run it on your laptop (python app.py, then http://localhost:5000). It behaves the same.
